

# BOLON 2022 – RECYCLING RESULTS

## RECYCLED MATERIALS IN ALL COLLECTIONS AND ALL FLOORS GIVES HIGHEST IMPACT

In 2021, we have reached our highest numbers of recycled material in our floors. During 2021 we reached 980 tonnes of recycled material. That's 300 tonnes more compared to year 2020. The increase is achieved by more supply of recycled material and the strategy of including recycled material in all collections and all types of floors instead of concentrating it to a selected line. Its unique that you freely can choose colours and design and always get the same environmental performance.

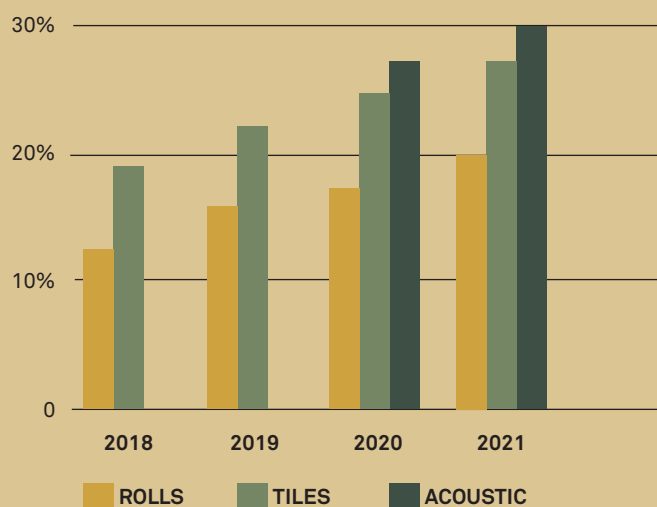

## INCREASED POST-CONSUMER WASTE

With our new and improved acoustic flooring, we introduced use of post-consumer waste. 12 % of the product comes from old PET bottles. With the increased sales of acoustic flooring the use of post consumer waste has increased 3,6 times.

## THE CONTENT OF RECYCLED MATERIAL INCREASED 62 % IN THREE YEARS

The proportions of recycled material vary across the product types: rolls, tiles and acoustic tiles. The reason is that the products have different weight of the backing layers.

## DEVELOPMENT OF PERCENTAGE RECYCLED MATERIAL PER TYPE OF FLOOR

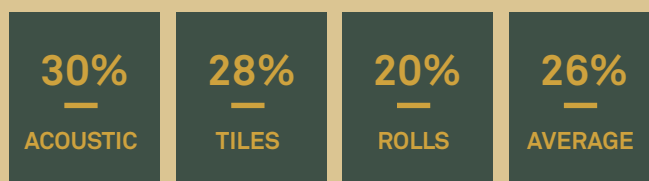

Over the past four years, all three of our product types have increased in the proportion of recycled material. In average 62 % over three years. Acoustic flooring stands out where we have gone from zero to 30% recycled material through a new sound-absorbing product type.

## RECYCLING CONTENT 2022

Calculations refer to yearly data from 2021. The assets for recovered material varying with approximate +/- 4% on a monthly base. Therefore we use average yearly numbers. Calculations is based on the mass of recycled content and total product weight in accordance with standard.

## RECYCLING FIGURES FOR 2022:

## OUR PROMISE: 50 % CIRCULAR

Bolon has set a clear goal towards circularity and reduction of our climate footprint. By 2028, all flooring we produce will be 50 % circular with half the climate impact it has today. With an average of 26 % recycled content we have come half the way towards the 2028 goal. Also climate impact decreases when using more recycled material.
